

# Application Ingress Automation with F5 in an OpenShift Environment

**Tyler Hatton**

Technical Solutions Architect

# Agenda

+

**OPENSIFT**

OpenShift/K8s Refresher

Overview

The Challenges

F5 and OpenShift

Container Ingress Services

Architecture & How it Works

Demo

## F5 Red Hat OpenShift Lab

 Bookmark 52 people launched

### Solution Overview

The way applications are being built and deployed is in a state of change. Previously, monolithic applications were converted to containerized microservices, leading to higher efficiency and flexibility of resources. Now there is a new set of challenges around migrating applications to containers.

This lab demonstrates how F5 Container Ingress Services integrated with Red Hat OpenShift can provide security, scalability and availability of containerized applications in an enterprise environment.

LAUNCH LAB

# *OpenShift Refresher*

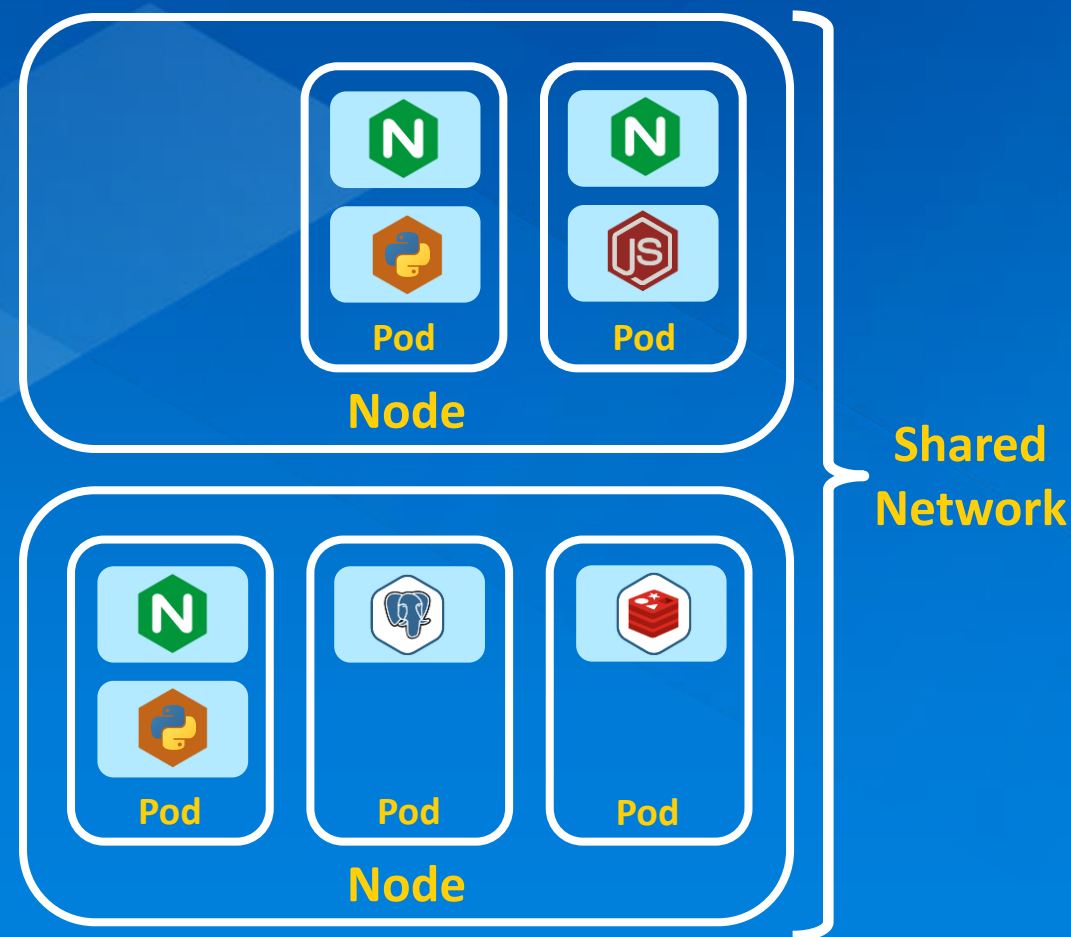

**Red Hat OpenShift** is an enterprise-ready Kubernetes container platform with full-stack automated operations to manage hybrid cloud and multicloud deployments.

# OpenShift Refresher

A **node** is a worker machine in Kubernetes and provides the runtime environment for containers

A **pod** is one or more closely related containers deployed to one host

# OpenShift Refresher

A **router** manages external access to services hosted within an OpenShift cluster

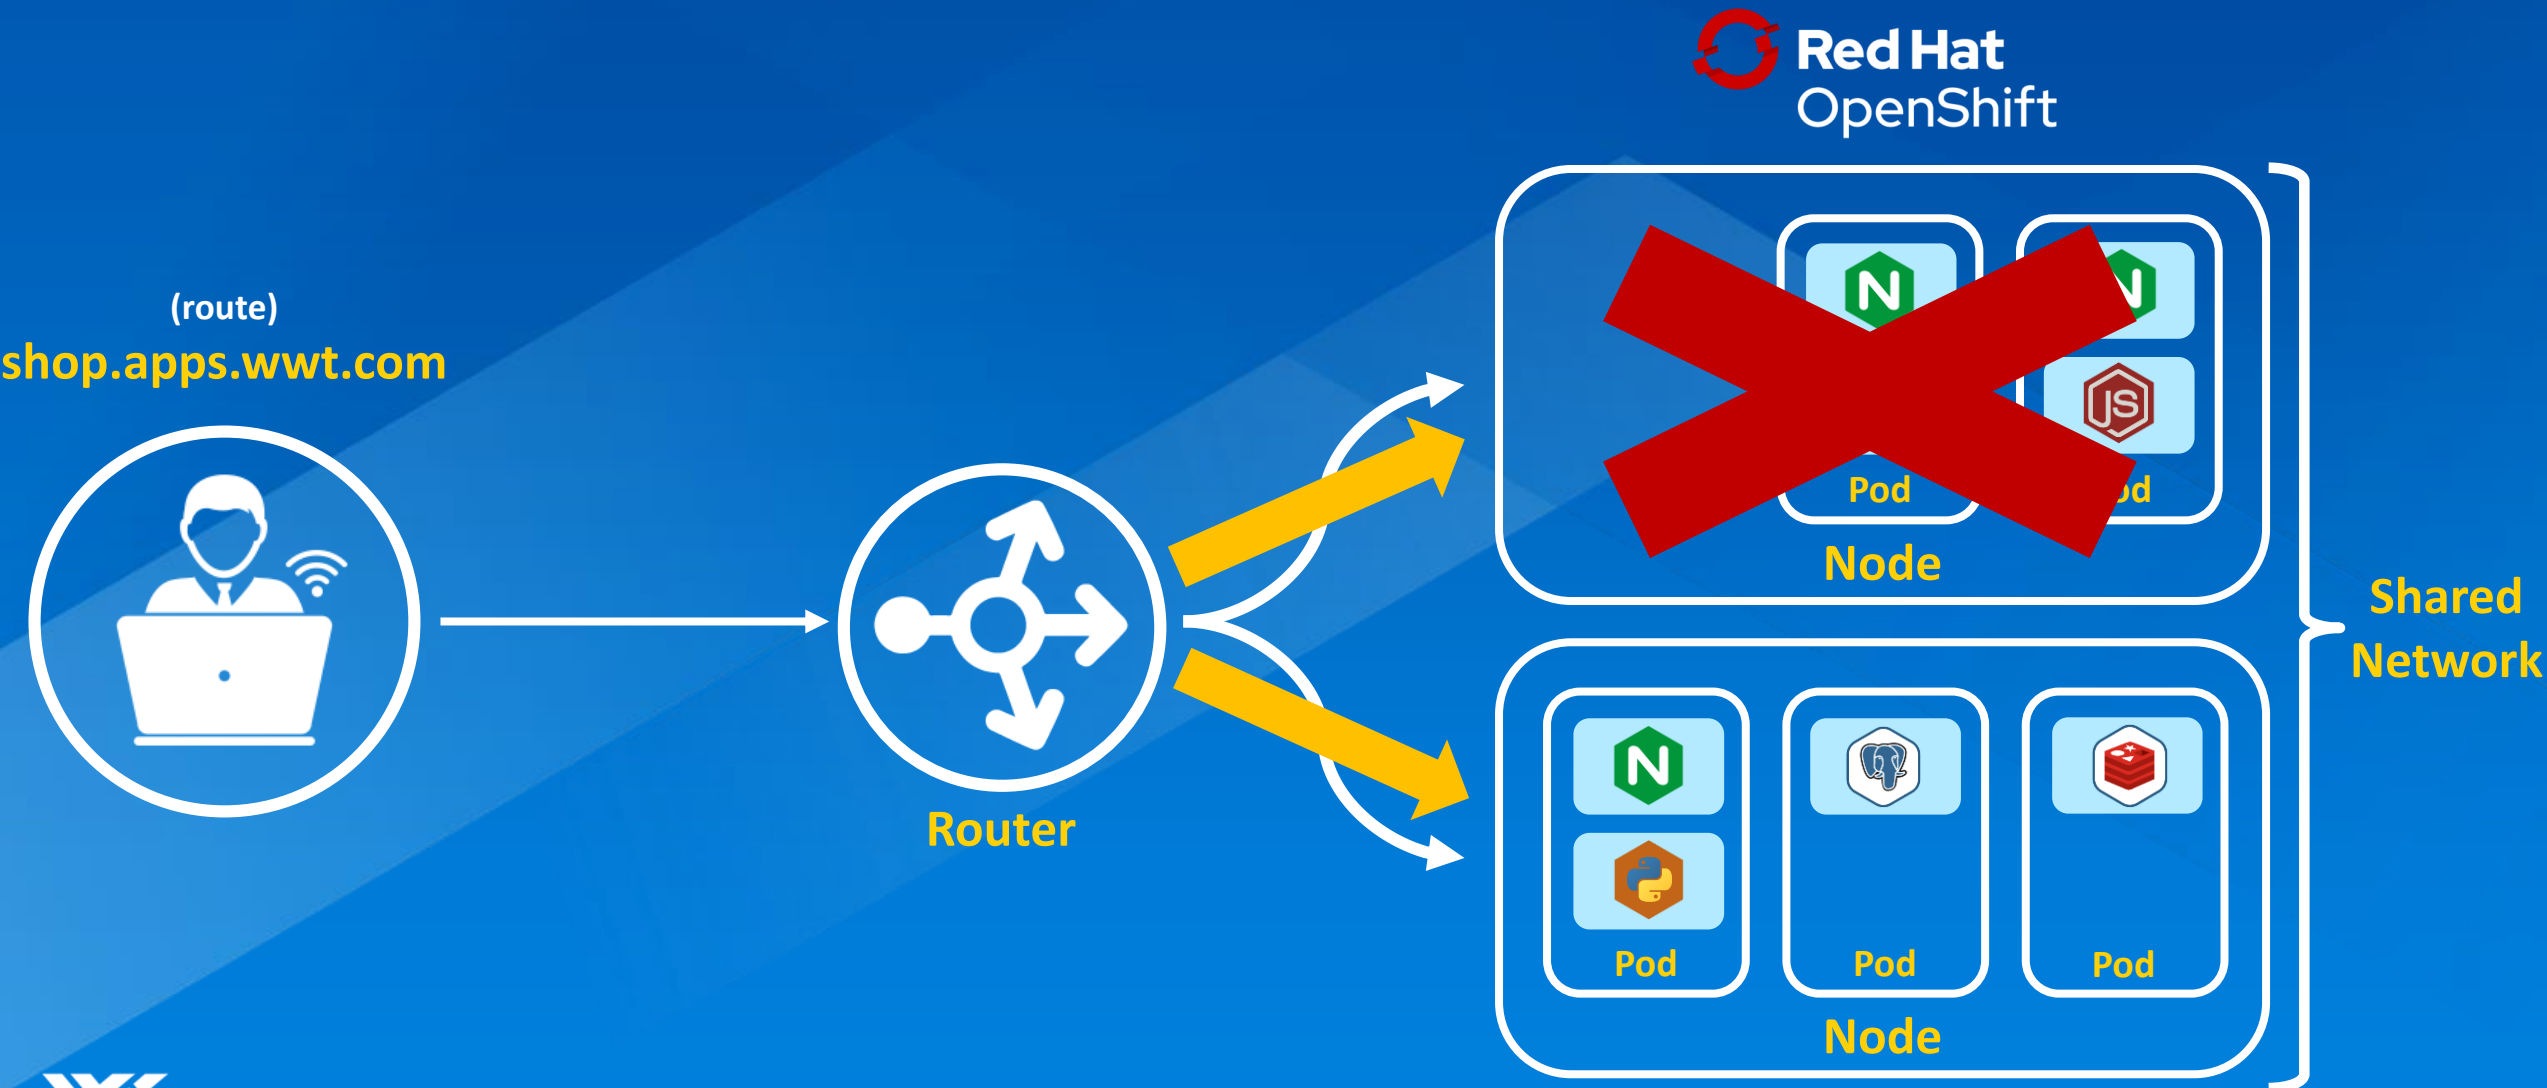

Router

Shared Network

# Container Ingress Services

## F5 Container Ingress Services (CIS)

integrates with container orchestration platforms to dynamically create L4/L7 services on F5 BIG-IP

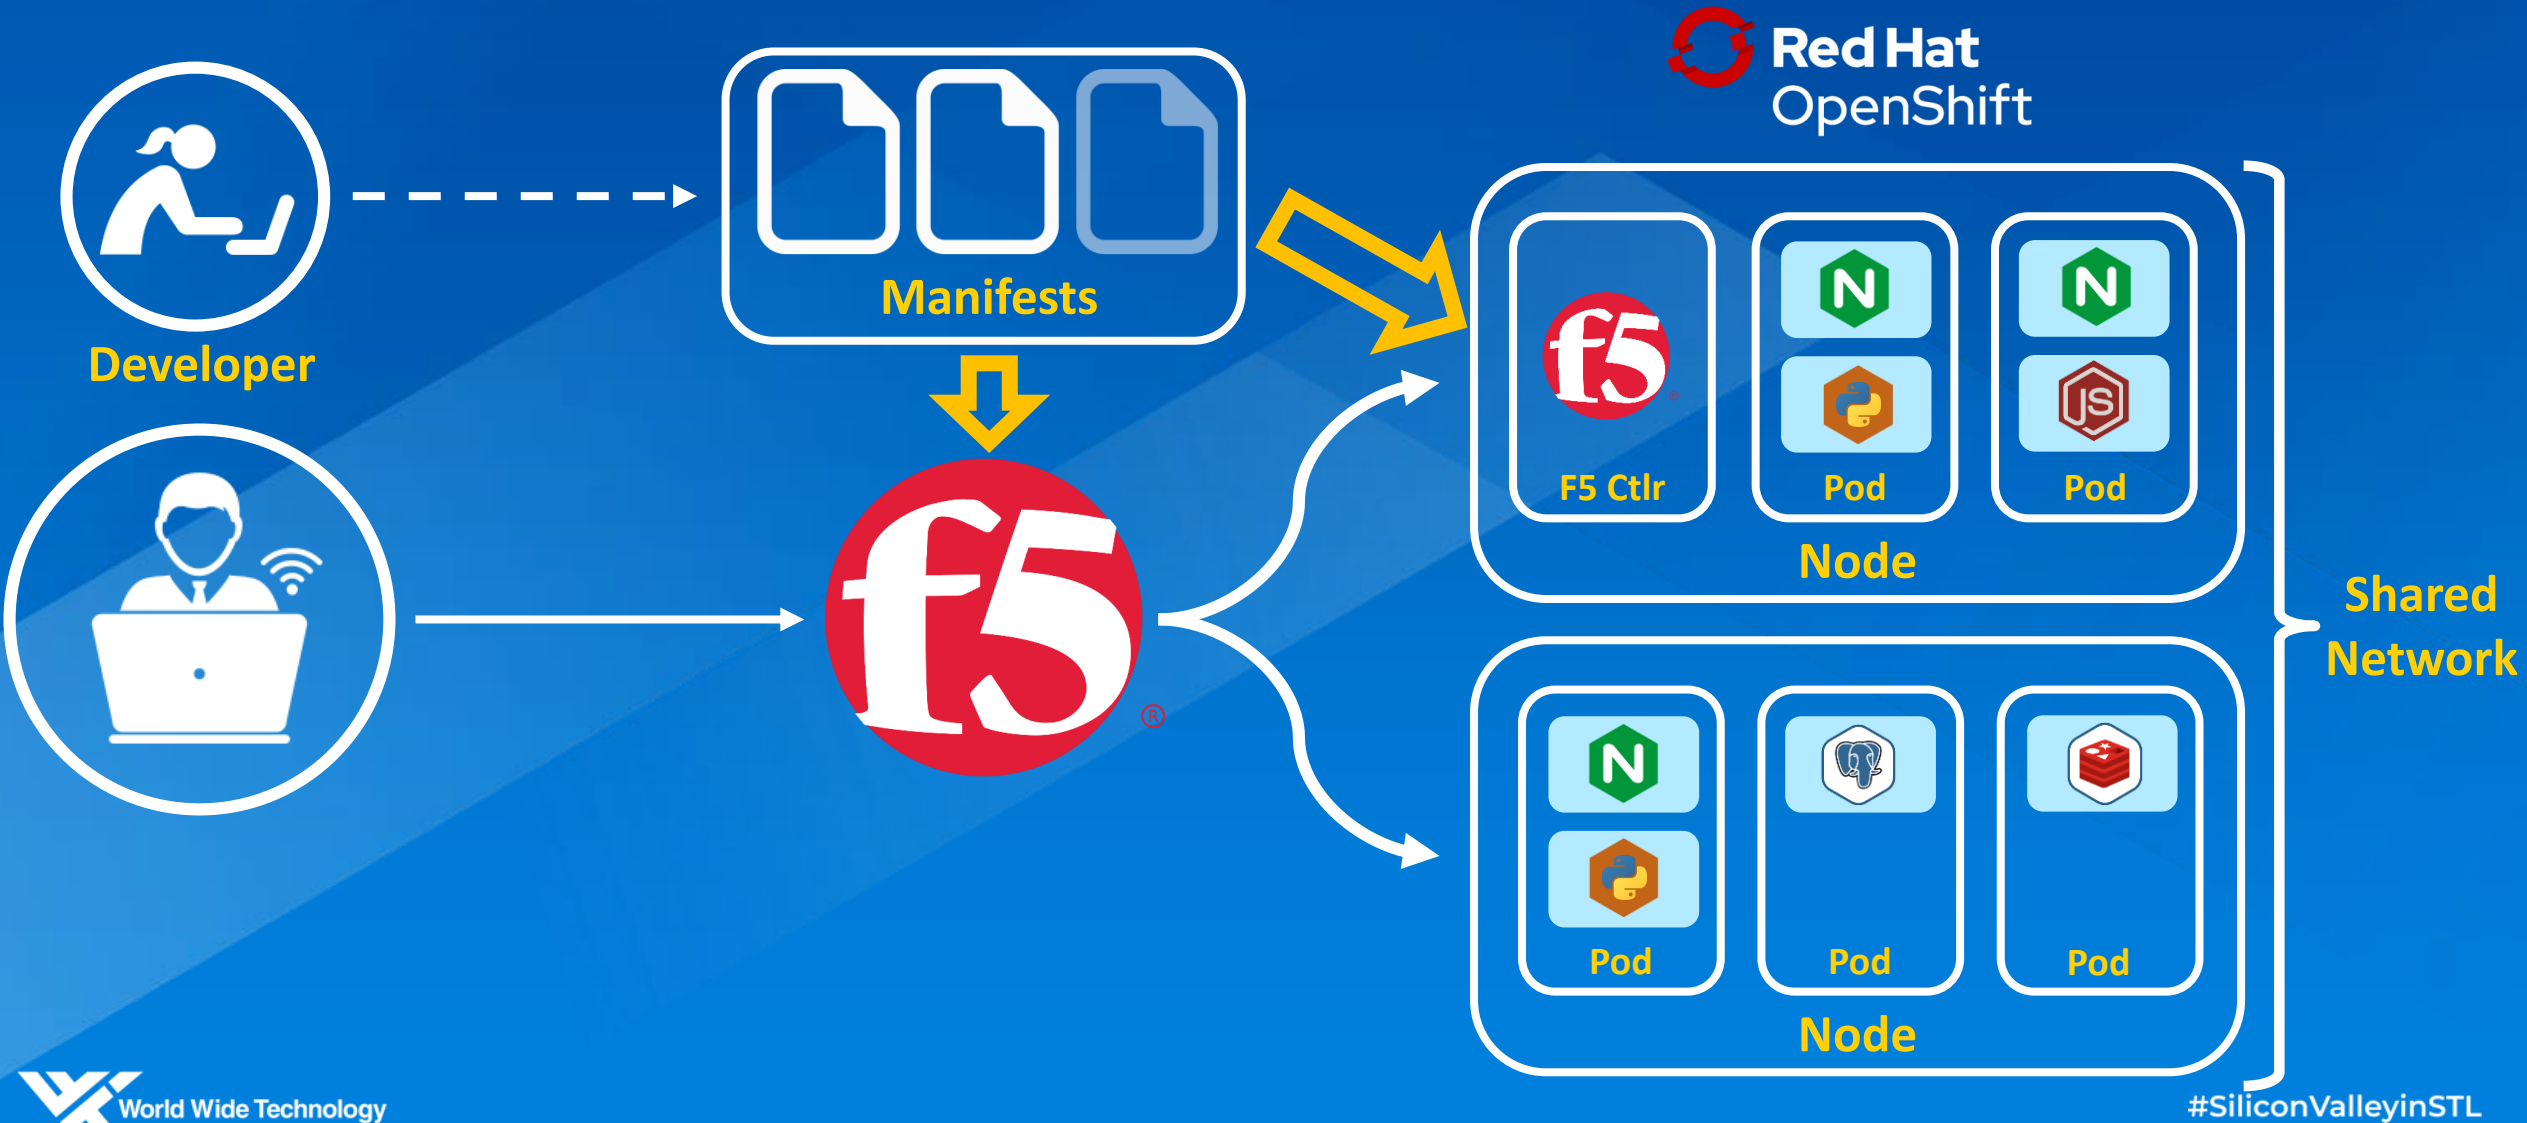

**f5**  
App Security  
Access Control  
TLS Termination  
Legacy Support

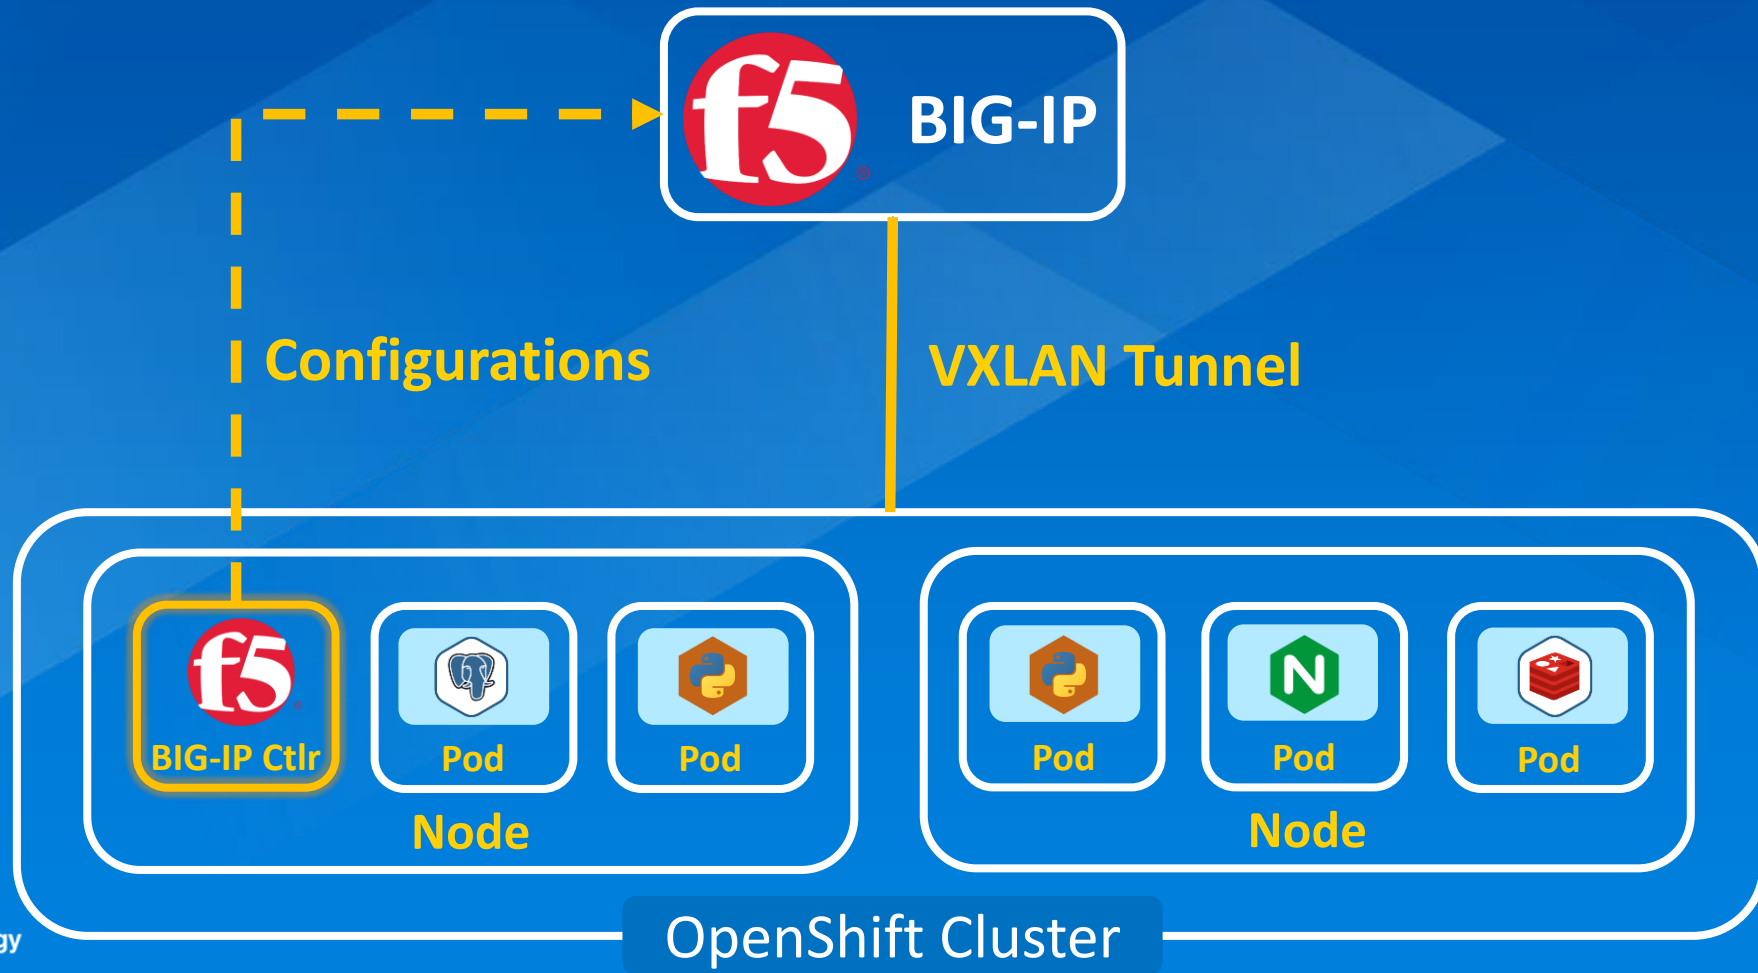

# *Simplified Deployments*

# CIS Components

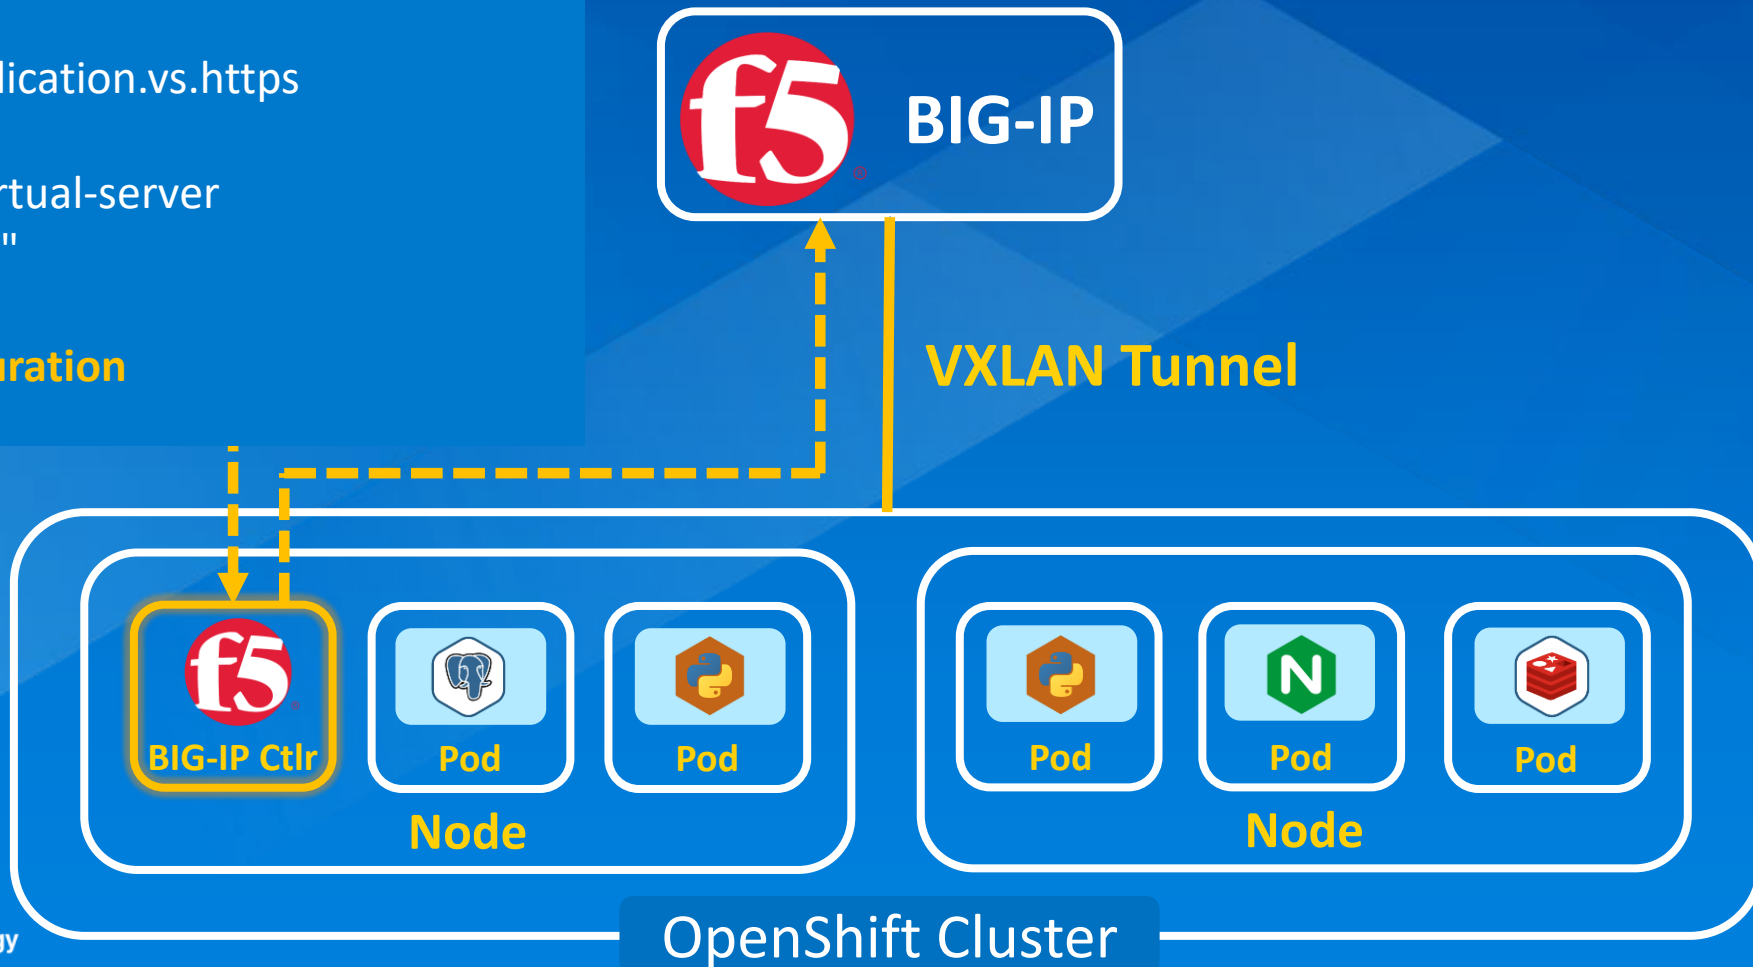

# CIS Components

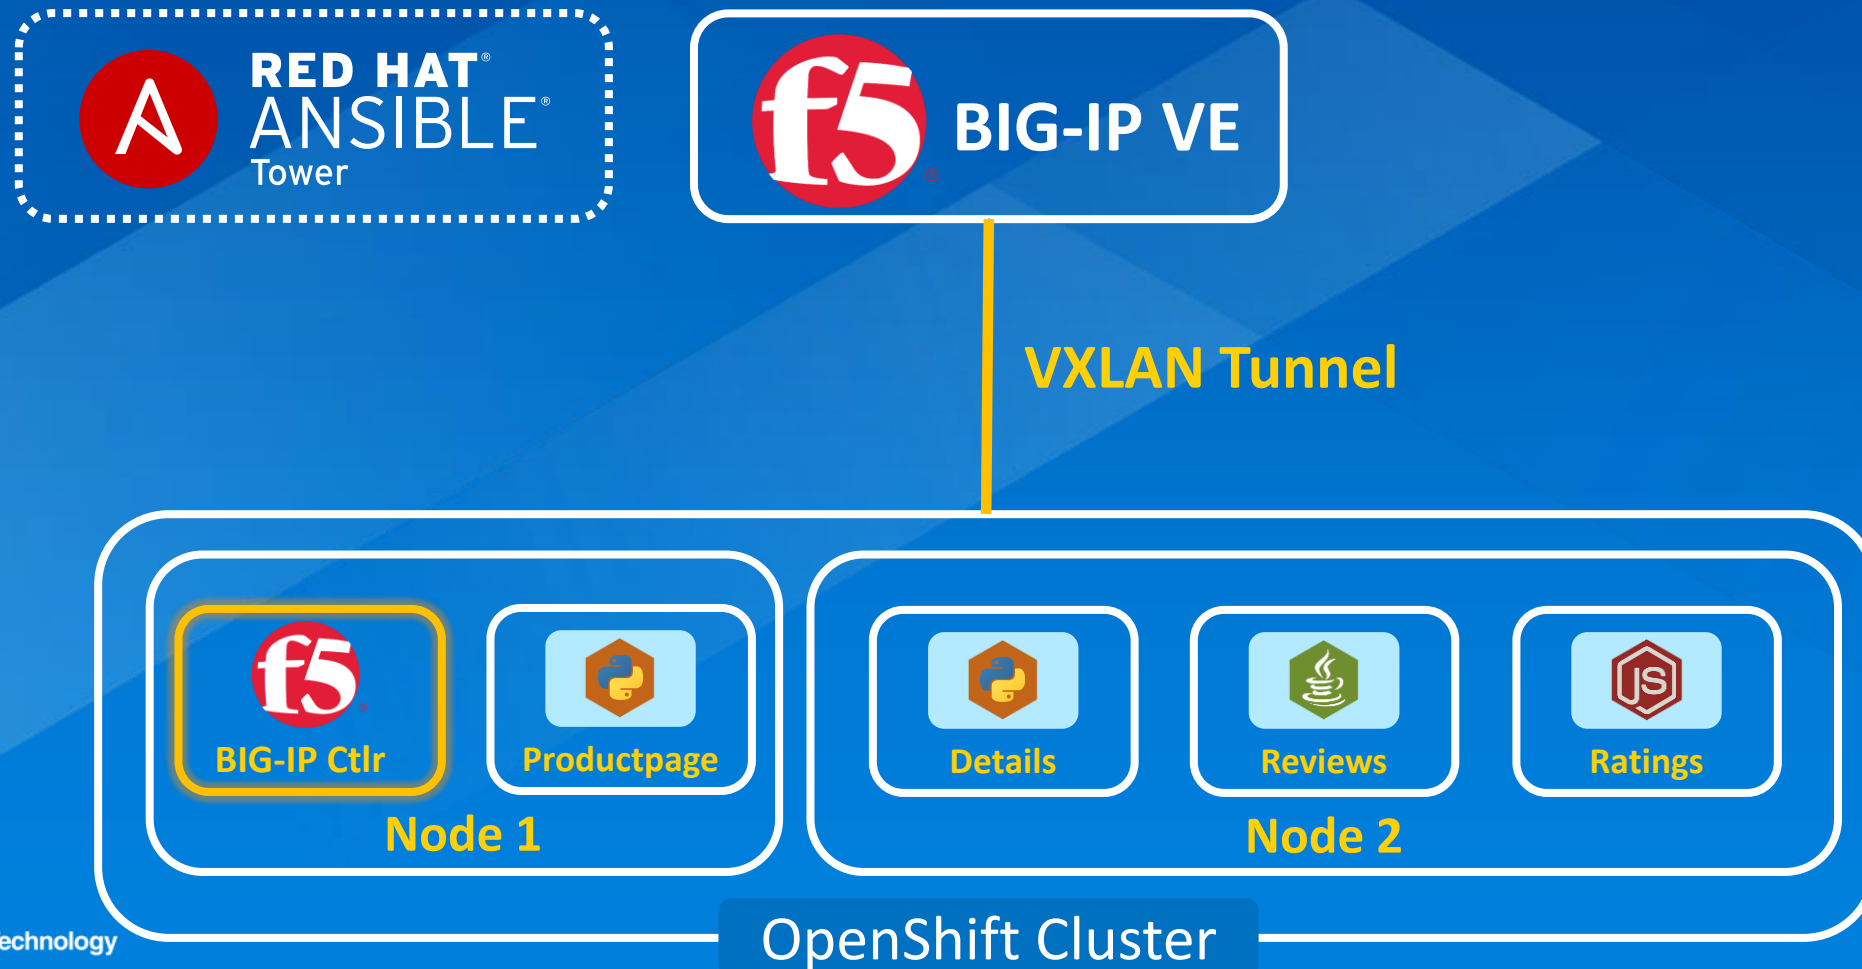

## Configmap

```
kind: ConfigMap
apiVersion: v1
metadata:
  name: application.vs.https
labels:
  f5type: virtual-server
  as3: "true"
data:
```

## F5 Configuration

## F5 OpenShift Webinar

F5 Container Ingress Services integrated with Red Hat OpenShift can provide security, scalability, and availability of containerized applications in an enterprise environment. With application development and deployment methods changing, monolithic applications are a thing of the past while containers and microservices are on the rise. New application architectures add new complexities for engineers and developers. Learn how to simplify and accelerate the application development lifecycle, how F5 Container Ingress Services can help your organization scale and secure containers, and how Ansible can automate the configuration process with Infrastructure as Code.
